

Fact Sheet

Federal Student Loan Limits for Graduate and Professional Programs

The Issue

The One Big Beautiful Bill Act (OBBBA) established new borrowing limits for students seeking federal aid. Beginning July 1, 2026, students enrolled in graduate degree programs will be limited to annual loans of \$20,500, with an aggregate limit of \$100,000 for a program of study; students enrolled in professional degree programs will be permitted to borrow up to \$50,000 per year, with an aggregate cap of \$200,000.

To inform rulemaking to implement these new requirements, the Department of Education (DOE) convened the Reimagining and Improving Student Education Committee, which recommended an updated definition of a professional degree program. Specifically, the committee recommended that the definition of a professional degree be narrowed to 11 fields: chiropractic, clinical psychology, dentistry, law, medicine, optometry, osteopathic medicine, pharmacy, podiatry, theology and veterinary medicine. This excludes critically important health care professional degree programs, such as nursing, social work, physician assistant, physical therapy and occupational therapy, among others. On Jan. 29, the DOE issued a proposed rule with the committee's recommendation. If it is adopted, students seeking degrees across a number of health care fields will be subject to lower annual and aggregate caps on federal student loans.

Our Take

We urge the DOE to include a full range of health care post-baccalaureate professional degree programs in its definition of professional degrees. Our health care system — and hospitals in particular — cannot operate without advanced practice registered nurses, social workers, physical therapists, occupational therapists, respiratory therapists, speech language pathologists, physician assistants and others. In order to practice in the hospital setting, professionals in these fields must receive advanced degrees and obtain licensure. The rigorous academic, licensure and training requirements — key components of the committee's recommended update to the definition of a professional degree — underscore the importance of including these fields in the new definition.

Furthermore, excluding certain health care programs from the proposed definition of a professional degree could exacerbate the ongoing shortage of health care professionals. Restricting the ability of borrowers to access federal student loans in amounts necessary to cover the cost of tuition would prevent many qualified candidates from enrolling in or completing these programs. Given the significant strain on the health care system, ensuring a pipeline of highly educated health care professionals is essential.

Background

Health care — and hospital care in particular — requires a full team of highly trained health care professionals working together to provide high quality, comprehensive, person-centered care. This interdisciplinary model is more important than ever to address increasingly complex health needs, with 3 in every 4 Americans having one chronic condition and more than half of all Americans having more than two.

Average loan costs across health care workforce programs are higher than the graduate-level limitations established by OBBBA. According to the National Center for Education Statistics, the average cost of attendance for nurses and social workers pursuing graduate degrees is more than \$30,000 per year, exceeding the \$20,500 annual loan cap for graduate degrees. For physical therapists, the American Physical Therapy Association reports the average cost of attendance is between \$108,212 and \$126,034, before living expenses, fees and other costs.

Despite the demand for health care workers, persistent shortages risk access to care. As of January 2026, approximately 92 million people lived in a primary care Health Professional Shortage Area. If implemented, a narrowed definition of a professional degree could make these shortages worse. As the need for health care workers continues to grow, reduced loan access would:

- Increase out-of-pocket costs for students or force students to take on a patchwork of private loans at higher cost.
- Reduce enrollment in advanced practice registered nurse (APRN) and other advanced degree health care programs because prospective students cannot finance tuition and living costs.
- Shrink the pipeline of qualified faculty, making it harder for schools to expand enrollment in undergraduate, graduate, and doctoral programs, and thereby exacerbating existing workforce shortages.
- Narrow the supply of clinicians who provide primary care, maternal health, behavioral health, and rural/safety-net services and long-term support services.
- Disproportionately impact rural and underserved areas by limiting access to high-need critical services provided by APRNs, like anesthesia and obstetrical care. Certified registered nurse anesthetists administer anesthesia in 70% of rural hospitals, and over half of U.S. counties have no obstetric physician.
- Result in longer wait times for patients, delayed diagnoses and increased emergency visits, ultimately raising costs and straining health systems.
